T3 Cancer of the Esophagus and GE Junction

Anatomy

Food moves from the throat

- → esophagus
- \rightarrow stomach
- → small bowel (jejunum)

1

2

Types of Esophageal Cancer

There are two common types of esophageal cancer

- Adenocarcinoma
- Squamous Cell Carcinoma

Cancer Staging

Staging refers to the tests to determine

- How large is the tumor?
- Has there been spread to lymph nodes?
- Has it spread to other parts of the body?

Treatment options depend upon the cancer stage

3

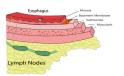

1

Cancer Staging

- T = Tumor Depth of growth into the wall
- N = Nodes Spread to the lymph nodes
- \bullet M = Metastasis Spread to liver, lungs, or bone

Early Stage Cancers

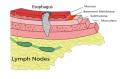

Cancers start on the very inside layer called the mucosa

5

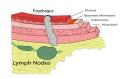

Locally-advanced Cancers

Over time, cancers can grow into the muscular wall

Lymph Nodes

In some cases, cancer cells can break off from the main tumor and spread to lymph nodes

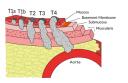

7

8

T Stage

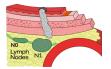

Cancers are categorized based upon the thickness of the tumor, known as the T stage

N Stage

Cancers are categorized by whether there is spread to the nodes.

- NO cancers have not spread to the nodes
- N1 cancers have spread to the nodes.

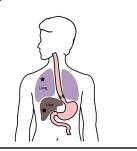

9

10

M Stage

Some cancers spread to other parts of the body

- M0 cancers have not spread to other parts of the body
- M1 cancers have spread lungs, liver, or bone

PET scan

Similar to CT scan

- Tracer shows 'hot spots'
 - Cancer
 - Inflammation or infection
 - Normal organs (heart)

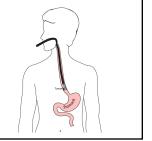

11 12

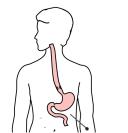

Endoscopic Ultrasound

- Similar to upper endoscopy (EGD)
- Ultrasound in scope
- Evaluates T stage

Laparoscopy

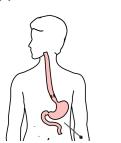

- Some stomach cancers can spread inside the abdomen
- Areas of spread can be very small (grain of rice)
- Laparoscopy can detect spread inside the abdomen

13

Laparoscopy

- General anesthetic
- Several 1/4" incisions
- Telescope examines the abdomen
- Biopsies can be performed.

Treatment Plan

Superficial (T1)

- Endoscopic Therapy Localized (T1b/T2)
- Surgery (esophagectomy)
 Locally-advanced (T3M0)
- Chemo \pm Radiation \rightarrow Surgery
- Metastatic (M1)
- Chemotherapy

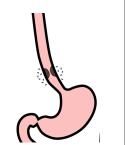

15

16

14

Locally-advanced cancers

Patients with locallyadvanced esophageal cancer often have localized spread of cancer cells in the surrounding area

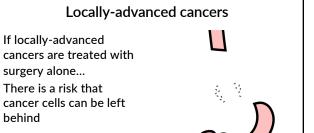

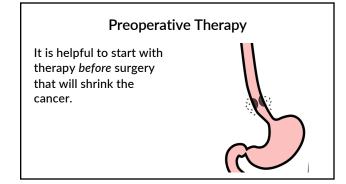

Locally-advanced cancers

If locally-advanced cancers are treated with surgery alone...

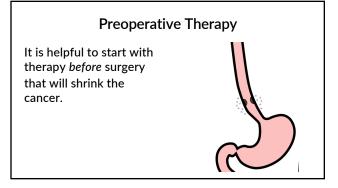

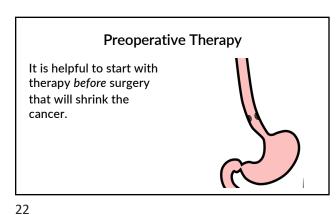

17 18

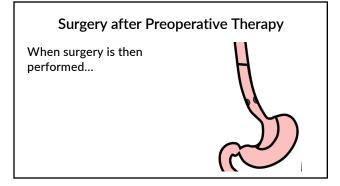

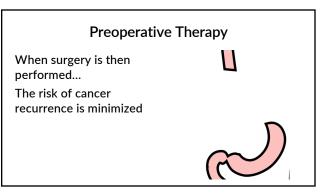

behind

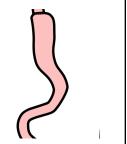

Preoperative Therapy

When surgery is then performed...

The risk of cancer recurrence is minimized

Chemotherapy + Radiation CROSS Trial

363 patients with esophageal cancer studied Patients were treated in two groups:

Surgery Alone

26

Chemo + Radiation → Surgery

25

Chemotherapy + Radiation CROSS Trial

363 patients with esophageal cancer studied Chemotherapy + radiation together over 6 wks **Surgery Alone**

Chemo + Radiation→Surgery ⇒ Longer Survival

Chemo + Radiation CROSS Trial

Typical schedule for chemotherapy + radiation:

- Chemotherapy once per week for six weeks
- Radiation five days per week for six weeks (28)
- PET scan (or CT) 4 weeks after the end of radiation
- Surgery 8 weeks after the end of radiation

28 27

Chemo + Radiation - Side Effects

Kills cancer cells in the esophagus and lymph nodes Can also irritate the lining of the esophagus. Swallowing can be difficult the last 2 weeks. Feeding tube may be needed for hydration/nutrition.

Locally-advanced Adenocarcinoma

"Sandwich" chemotherapy before + after surgery: Chemo (8 wks) → Surgery → Chemo (8 wks) Two different drug combinations:

- FLOT (more effective)
- FOLFOX (better tolerated)

29

"Sandwich" Chemotherapy Drugs

FLOT

FOLFOX

•5-FU

- •5-FU
- Leucovorion
- Leucovorin
- Oxaliplatin
 - Oxaliplatin
- Taxotere

Adenocarcinoma Treatment Options

Chemo + Radiation

Chemotherapy

- Chemo+Radiation (6 wks)
- Chemotherapy (8 wks)
- Surgery
- Surgery
- Chemotherapy (8 wks)

31

32

Adenocarcinoma Treatment Options

CROSS Chemo + Radiation

FLOT Chemotherapy

- Longer track record
- More effective
- Better tolerated
- More side effects
- Port always required
- · Port usually placed
- Eating gets slowly
- Eating worse → better
- · May need feeding tube
- · Feeding tube less likely

Chemotherapy Administration

Most chemotherapy is administered by vein.

Several options exist to administer chemotherapy:

- Intravenous catheter in peripheral veins
- Peripheral Intravenous Central Catheter (PICC)

PICC Lines

Central Venous port

Placed in Radiology

of treatment

and dry

• Stay in place during all

• Needs to be kept clean

 Suitable for FLOT chemotherapy

33

34

Intravenous Catheter in Peripheral Vein ("IV")

- vein of hand or arm
- · Allows administration of chemo and fluids
- Placed for each dose
- · Removed that day
- Not suitable for FLOT chemo

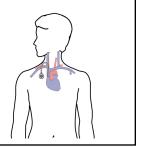

36

- IV catheter placed in

Central Venous Port

- Implantable device makes chemo easier
- May shower in 24 hrs
- No special care at home
- •OK for FLOT chemo
- · Allows for blood draws

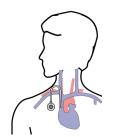

Central Venous Port

- Implanted under skin
- Neck incision (1/4")
- Incision below the collarbone
- Sutures dissolve

38

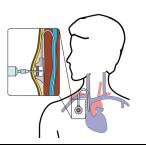

• "Superglue" on incisions

37

Central Venous Port

When it is time for chemotherapy, a needle is inserted through the skin into the port

Restaging

CT (or PET) scan performed after preoperative therapy

- Surgery performed after restaging
- Timing depends upon recovery from therapy

39 40

Primary Care Practitioner (PCP)

Critical to coordinate care between specialists. We will update your PCP after each visit PCP Referral Line (844) 235-6998

My Atrium Patient Portal

- Critical to good communication with your care team
- Available for desktop or laptop or phone
- Sign up at my.atriumhealth.org

Exercise

- Reduces risk of complications from treatment
- Goal is 30min/day of vigorous exercise 6 days/wk
 - Working hard enough that you can't converse
 - Start slowly and build up
 - Every day counts! (Aim for daily activity)

Smoking Cessation

- Smoking makes cancer treatment more difficult
 - Increases risk of complications after surgery
- Options for help with smoking cessation:
 - NC Quit Line 1-800-QUIT-NOW (1-800-784-8669)
 - American Lung Assn www.freedomfromsmoking.org
 - Smoking Cessation Counseling (Metro Charlotte)

43 44

Protein Needs

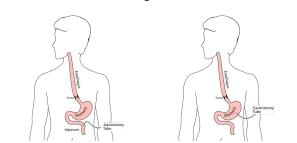

- Men: Average 75 grams/day
- Women: Average 60 grams/day Protein Shakes provide protein with minimal

sugar

Feeding Tubes

46 45

Gastrostomy Tube

Feeding Gastrostomy

- Feeding with a syringe several times per day.
- Tube can be hidden underneath clothing
- Tube does not interfere with eating by mouth
- Removed easily in the office when no longer needed

Gastrostomy Tube Methods

PEG: Tube placed by endoscopy

Laparoscopic: Tube placed surgically by laparoscopy Preferred method depends upon whether

esophagectomy is planned

47 48

Gastrostomy Tube

- Outpatient Placement (go home the same day)
- Central venous port can be placed at the same time (if needed)

Jejunostomy Tube

- Nutrition to bypasses the esophagus and stomach
- · Placed in small intestine
- Pump administers feedings slowly

50

• Feeding done at night

49

Jejunostomy Typical Regimen

- Jejunostomy tube feeds for 16 hours (6pm-10am)
 - Men: 75mL/hour x 16 hours = 5 cartons
 - Women: 60mL/hour x 16 hours = 4 cartons
- Water 240ml (8oz) via syringe 4x/day Hospital nurses will teach use of the feeding tube

Jejunostomy Feeds with Diabetes

Jejunostomy feedings elevate blood sugars

- Insulin may be required along with feeds Typical Pattern for tube feeds
- Feeds run via pump from 6pm to 10am
- Insulin at 6pm (70/30 insulin)
- Insulin at Midnight (70/30 insulin)
- No insulin if tube feedings are not run

51 52

Jejunostomy Video

A video is available to help become familiar with the feeding jejunostomy

Surgery for Esophageal Cancer

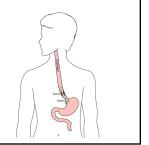

Surgery for esophageal cancer is performed for:

- Superficial Tumors (T1) not removed by endoscopy
- Localized Tumors (T2 N0 M0)
- Locally Advanced (T3 M0) after preop therapy

53 54

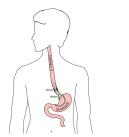

Goals of Surgery

- Remove tumor from esophagus
- Remove surrounding lymph nodes
- Create a new esophagus

Ivor Lewis (Transthoracic) Esophagectomy

- Removes tumor and lower 1/3 esophagus
- Removes surrounding lymph nodes
- · GI tract reconstructed

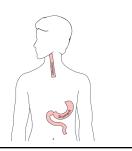

55

56

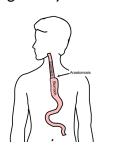

Reconstruction

New esophagus is created from the stomach in the abdomen by fashioning it into a tube.

Ivor Lewis esophagectomy

The new esophagus is now brought up into the chest. A connection is made between the esophagus and the stomach, called an anastomosis.

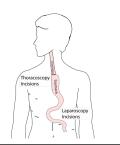

57

58

Minimally-invasive Ivor Lewis

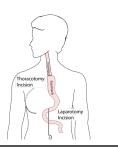

- Small incisions abdomen and chest
- Surgical telescope and instruments
- Smaller incisions → faster recovery and less discomfort

Open Ivor Lewis

Mininally-invasive approach feasible in 95% of cases

In some cases, an open approach is still necessary.

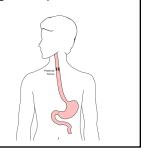

59

Total Esophagectomy

For patients with tumors in the upper esophagus, we need to remove more of the esophagus

We need to remove the whole esophagus, including the portion in

the neck

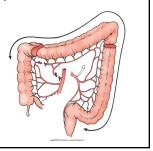

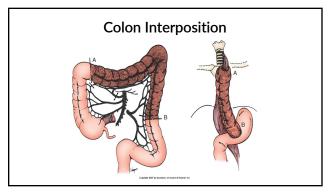

McKeown Esophagectomy

61 62

Colon Interposition

If the stomach is not suitable to make a new esophagus, the colon can be used to replace the esophagus

63 64

Risks of Esophagectomy

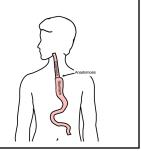

Esophagectomy is a complex operation, with a real risk of complications.

Two significant complications:

- Anastomotic leak
- Pneumonia

Anastomotic Leak

The anastomosis is surgical connection between the esophagus and the stomach.

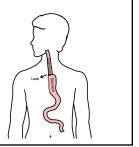

65 66

Anastomotic Leak

If healing doesn't occur:

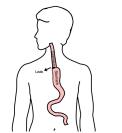

- Leakage of fluid from the esophagus
- Infection in the space between the lungs
- Requires additional time in the hospital

Anastomotic Leak

If leak occurs:

- · Some leaks will seal
- Stent may be required to help healing
- Occasionally additional surgey is required

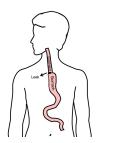

67

68

Anastomotic Leak

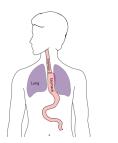

Risk of leak depends on:

- Type of operation performed
- Nutritional status of patient
- Experience of the surgeon

Pneumonia

- Occurs in 10-15% of patients after esophagectomy.
- Requires treatment with antibiotics
- Requires a longer hospitalization.

69

70

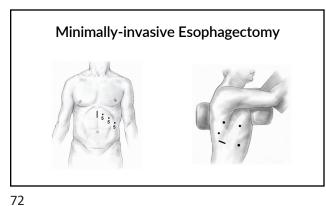

Preventing Pneumonia

Several ways to help prevent pneumonia:

- Deep breathing
- Coughing
- Walking

After surgery, this means:

- Sitting in a chair most of the day
- Walking in the halls as soon as possible

Risks of Surgery

Risks related to anesthesia

- Heart attack (5%)
- Irregular heart rhythm (15%)
- Pneumonia (10%)
- Blood clots in legs (<5%)
- Pulmonary embolism (2%)

Risks of Surgery

Risks related to Surgery

- Anastomotic leak (5%)
- Stricture at anastomosis (15%)
- Death within 90 days of surgery
 - Low risk patients = 2%
 - Intermediate risk = 10%
 - High risk = 30%

74

73

Day Prior to Surgery

- Clear liquids for 24 hours prior to surgery
- Check with Pre-op nurse regarding medicines day prior to surgery
- No tube feedings the night before surgery

75 76

Day of Surgery

- Arrive at 5am nothing to eat or drink after midnight.
- Medicines OK w/ a sip of water
- sip of black coffee but no cream.
- Surgery will be cancelled if you have cream/milk
- Waiting room for family and friends on 5th floor

Epidural Catheter for Pain Control

- Remains in place for 2-5 days
- Dosage can be adjusted as needed
- Can make it more difficult to urinate
- May require foley catheter in bladder
- Foley catheter removed after epidural removed

77 78

ICU Stay (2-4 days)

- Surgical ICU on 11th floor
- NG tube in nose to drain stomach and esophagus
- · Catheter in bladder
- Chest tube right chest
- · Abdominal drains (usually 2)
- Feeding jejunostomy (usually stays in 8 wks)

ICU

- Bladder catheter removed → check that bladder empties properly
- Chest tube removed (day 2-4) → follow-up x-ray
- Fluid emptied from drains every few hours
- Start tube feedings by feeding
- Feeding jejunostomy (stays in 8 weeks)

79

Ward - 6Tower

- · Jejunostomy feeds started
- Up in a chair most of the day
- · Walking in the halls
 - Start with assistance
 - Improves lung function
 - Prevents loss of muscle strength

Jejunostomy Feeds

Jejunostomy tube feeds

80

- Start continuous (24 hours)
- Convert to night-time only (16 hours)

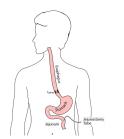

Water administered through feeding tube

- Usually 8oz 4 times/day
- Important to prevent dehydration

81 82

Jejunostomy Tube

- Nutrition to bypasses the esophagus and stomach
- Placed in small intestine
- Pump administers feedings slowly
- Feeding done at night

Jejunostomy Typical Regimen

- Jejunostomy tube feeds for 16 hours (6pm-10am)
 - Men: 75mL/hour x 16 hours = 5 cartons
 - Women: 60mL/hour x 16 hours = 4 cartons
- Water 240ml (8oz) via syringe 4x/day
 Hospital nurses will teach use of the feeding tube

Jejunostomy Feeds with Diabetes

Jejunostomy feedings elevate blood sugars

- Insulin may be required along with feeds Typical Pattern for tube feeds
- Feeds run via pump from 6pm to 10am
- Insulin at 6pm (70/30 insulin)
- Insulin at Midnight (70/30 insulin)
- No insulin if tube feedings are not run

Jejunostomy Video

A video is available to help become familiar with the feeding jejunostomy

85 86

Activity

- Up in chair most of the day
- Walking with help from nurse/Physical Therapist
- Goals:
 - Improve lung function
 - Prevent muscle loss

Nasogastric (NG) Tube

Tube passed through nose into stomach

- · Drains fluid from stomach
- Prevents vomiting

Upper GI X-ray on 2nd or 3rd day after surgery

- If stomach empties well → NG tube removed
- Otherwise, X-ray repeated 2-3 days later

87 88

Swallowing Evaluation

Once NG tube has been removed:

Modified barium swallow in radiology

- Drink a white chalky liquid (barium)
- · Look for proper swallowing function
- 70% of patients \Rightarrow liquids started by mouth

Protein Shakes

Most are taking protein shakes when they go home Protein shakes are started after tolerating water

- 2 oz per hour to start
- 4 oz per hour if 2oz are tolerated well

89 90

Discharge

Goal: ready to leave day #6/7 after surgery

- Night-time tube feedings (6pm to 10am)
- Nutrition by mouth (70% of patients)
 - 1 oz of water per hour by mouth OR
 - Protein shakes 4oz every 2 hours
- Water through tube 8oz four times per day
- Home care nursing (feeding tube teaching)
- · Home infusion (tube feeding supplies)

91

Nutrition after Surgery

At discharge home:

- Protein shakes 4oz every 2 hrs
- Tube feeds 4-5 cans at night (6pm-10am)

10-12 Days: Increase protein shakes

• Tube feeds 3-4 cans at night

Three weeks: Post-esophagectomy Diet

8-12 weeks: Remove feeding tube (in office)

Transition from Tube Feeds → Eating

Dietitian will calculate daily protein goal

- Typically 60-75 grams protein/day
- Each carton of tube feeding has 15 grams
 - 75 grams protein = 5 cartons/night
- More intake by mouth \rightarrow tube feeds reduced Spread out protein during the day (20gm/meal)
- Three meals + 2-3 high-protein snacks

Post-esophagectomy Diet

- Soft Consistency
- High Protein
- Avoid sugary liquids (can cause 'dumping')
- Avoid raw vegetables (and salads)
- Eating
 - Small, frequent meals
 - Sit up for 30-45 minutes after eating
 - Avoid eating within 2 hours of bedtime

93

94

92

Medicines at Home - Pain

Acetaminophen (Tylenol) 1000mg 4x/day Gabapentin 300mg 3 times/day Oxycodone

- As needed in addition to Tylenol/gabapentin
- Will begin reducing dose at first postop visit
- Can usually discontinue by 4 weeks
- NO DRIVING WHILE ON OXYCODONE

Non-steroidals Anti Inflammatory (NSAID)

Non-steroidal anti-inflammatories (Celebrex)

- 200 mg every 12 hours starting at 2 weeks NO GOODY POWDERS OR BCs
- (Can cause permanent scarring at the surgery site)

95 96

Acid Blockers = Proton Pump Inhibitors

Examples include ompeprazole and pantoprazole

- Will stay on for at 1-2 years to prevent acid reflux
- Important in preventing scarring at anastomosis (new connection between esophagus and stomach)
- To administer through feeding tube, open capsule and resuspend beads in 60mL (2oz) of water

Medicines at Home

Reglan - Helps stomach empty

- Will plan to stop after six weeks
- 0.1% risk of tardive dyskinesia (nervous tic)

Remeron - Helps improve appetite

- · Can cause vivid dreams
- Used for several weeks after surgery
- Will stop within first three months of surgery

97 98

Metoprolol = Beta Blockers

- Slows heart rate and lowers blood pressure
- Used to prevent rapid heart rate
- Patients not taking a beta blocker prior to surgery
 → wean after after surgery
- Patients taking a beta blockerprior to surgery → return to prior dose and drug after surgery

Sleeping

Reflux can occur the first few weeks/months after surgery

This improves over the first few months

A wedge pillow can be helpful for sleep

99 100

Postoperative Visit

Check surgical site

• Remove staples (if needed)

Adjust medicines as needed

- Insulin (for diabetic patients on insulin)
- · Reduce beta blocker medicines

Advance diet

Reduce tube feeds

After surgery

Wean off medicines added after surgery

- Pain medicines
- Beta-blockers
- Reglan and Remeron

Continue acid blockers for at least 1 year

101 102

Jejunostomy Removal

Jejunostomy tube is removed in the office once you can take in enough nutrients by mouth

Removal usually around 8 weeks after surgery May take 30 minutes and some local anesthetic to loosen up the tube for removal.

Nutritional Monitoring after Surgery

You may have difficulty absorbing some nutrients:

- Iron
- Vitamin B12
- Vitamin D

103 104

Nutritional Monitoring after Surgery

About 3 months after the jejunostomy tube is removed, we will check blood levels:

- Iron (ferritin)
- Vitamin B12
- Vitamin D

Nutritional Replacements after Surgery

Vitamin or iron replacements can be ordered by:

- Primary Care Provider (PCP)
- Medical Oncologist
- Surgeon

If levels are low

- Replacement
- Repeat testing in 3-6 months

105 106
